Materials and Devices NLR develops photovoltaic (PV) materials and devices to achieve higher performance and reliability at lower cost.

Materials used in photovoltaic devices are usually silicon (monocrystalline, polycrystalline or amorphous), gallium arsenide, metal chalcogenides and organometallics.

A thin-film solar cell is made by depositing one or more thin layers of PV material on a supporting material such as glass, plastic, or metal. There are two main types of thin-film PV semiconductors on ...

With a growing array of materials being explored for photovoltaic applications, ranging from traditional silicon-based semiconductors to emerging organic, perovskite, and thin-film materials, understanding ...

This Review compares the state of the art of photovoltaic materials and technologies, detailing efficiency limitations and the innovations needed to overcome them.

This cohesive overview emphasizes the significance of sensible heat storage systems and the diverse materials utilized, highlighting their practical applications in meeting the thermal demands ...

The aim of this article is to illustrate the current state of art on photovoltaic cell technology in terms of the materials used for the device fabrication, its efficiency and associated costs.

This paper mainly focuses on PV power optimization using solar tracking and floating PV systems, as they are currently among the hot topics in solar power generation and are gaining the ...

The exploration of materials utilized in solar photovoltaic technology reflects an intricate interplay between innovation, sustainability, and market dynamics.

Explore the latest advancements in photovoltaic materials and their applications in renewable energy
